Config

A Config instance is used to configure the DASH instance for use.

- **TEAM IDENTIFIER**
  - The unique identifier for the team provided by DASH. This is used to tailor the experience per team.
- **DISTRIBUTOR IDENTIFIER**
  - A unique identifier for the app distributor implementing DASH in their app. We will provide this to you.
- **APPLICATION IDENTIFIER**
  - A unique identifier for the individual application using DASH. (The bundle identifier for iOS apps)

DASH

A DASH sharedInstance is the main class for interacting with the SDK. Use this instance to handle deep link URLs and to instantiate a view controller to show the DASH interface.

- **public void startWithConfig(Config config)**
  - Initializes the SDK. Call this once before any other methods.
- **public void setUserEmail(String email)**
  - Sets the current user's email. Email is used to uniquely identify a user in the DASH system.
- **public Fragment dashFragment()**
  - Returns a DASH fragment for display.

Vendor Requirements
- Specify APNS Cert and FCM sender ID per team.
